                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This cDNA sequence represents a human tata-binding protein associated factor, hTAFII105, isolated from Daudi cell nuclear extracts. Tightly associated subunits (TAF's) are components of the transcription factor FIID and are thought to mediate transcriptional activation. This encod protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFII105 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for hTAFII105 transcripts), therapy (e.g. gene therapy to modulate hTAFII105 gene expression) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating cell specific activators or other transcriptional regulators).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reactivity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II), (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving continuous and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity

                                                                                                                                                                                                                This represents a polypeptide comprising a (modified) fragment (I) a TATA box-binding protein associated factor II 105 (TAFII105). A pharmaceutical composition comprising (I) or the polynucleotide or inhibitor or antagonist of (I) is useful for treating cancers and inducing apoptosis in pathological cells. The composition is also u for treating autoimmune diseases, inflammatory processes and viral bacterial infections.

The TATA-binding protein associated factor hTAFII130 (including specific antibodies and fusion products) are used in drug screening, diagnostics and therapeutics. They are used in the development of specific biochemical assays for screening compounds that agonise or antagonise selected transcription factors involved in regulating gene expression associated with human pathology.
                                                                                                                     Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of the human TATA-binding protein (TBP) associated factor (TAF) designated TAFIII30. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. Wt. of 130 kD by SDS-PAGE.

The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFS. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum ralsed against the TFIID fraction allowed cloning of the corresp.

Tjian R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAW25018 represents TATA-binding protein associated factor (TAF) polypeptide, hTAFII100 (mol. weight 100kD). TAF peptides derived from hTAFII30 alpha, hTAFII30 beta, hTAFII40, hTAFII70, hTAFII100, hTAFII130 alpha, hTAFII30 beta, hTAFII10 and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, if and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator, or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

                     The invention describes a method of screening a candidate antifungal compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcription. The proteins tested in the CC invention include RPC34, POP3, TFA2, NAB2, MPT1, MTR2, BOS1, POL30, RSA2, CC SQT1, MTW1, TFB1, SPC98, BRR2, RNA1, GCD7, SKI6, NIP1, LCP5, NCE103, CC ECO1, ORC2, CNS1, PDP1, TIM10 and SR84 from S. cerevisiae, C. albicans CC and human homologues. The method involves contacting a culture with one CC viability of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or CC modulate (preferably inhibit) activity of C. albicans EP. The inhibitor CC compounds identified by the method are useful for preventing or CC inhibiting fungal agents interact with essential fungal elements CC mammal. The antifungal agents interact with essential fungal elements CC that can be used to treat fungal infection by preventing the growth and CC preferentially killing the fungal, but does not inhibit the biological activity of mammalian homologues. This amino acid sequence represents a CC method of the invention.
                                                                                                                                                                                                                                                                                                                                                                             protein,

The encoded protein has an estimated mol. wt. of 110 kb y SDS-PAGE, a calculated mol. wt. based on sequence of the gene of 9.4 kb and an estimated pI of 10.1. The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFS. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the correspondence from lambdaratil expression libration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of the Drosophila TATA-binding protein (TBP) associated factor (TAF) designated TAFIII10. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein

nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptide, dTAFII110 (mol. weight 110kD). TAF peptides derived from dTAFII30 alpha, dTAFII30 beta, dTAFII40, dTAFII60, dTAFII80, dTAFII110, dTAFII150, and dTAFII250, their human equivalents and nucleic acids encoding them, are used to modulate transcription,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TATA-binding protein associated factor; TAF; nuclear protein; RNA polymerase transcription; TATA-binding protein; TBP; initiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        compound, typically or DNA.

                                                                                                                                                                                                capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                    HCF is required for the transcription of a number of viral genes, such as the immediate early herpes simplex virus-1 genes. Epitopes of the encoded protein can be used in defining functional domains of HCF, identifying compounds that associate with HCF or designing compounds capable of modifying HCF transcription. Such agents can be used to treat viral infections.
                                                                                                                                                                                         New Host Cell Factor polypeptide(s) and nucleic acid - are us to develop agents for diagnosis or treatment of disease associated with expression of a HCF-modulated gene e.g. viral

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                             sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                        genes from Drosophila and for elucidating cell signalling and interactions \boldsymbol{\cdot}

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
